

The original Script Contract v28 was the execution specification used to generate the frozen PythonApplication157 evidence boundary.

Because the final manuscript adopts a more formal path terminology, this addendum provides a publication-nomenclature crosswalk.

The crosswalk is editorial and interpretive only. It does not modify the algorithms, scripts, input files, output artifacts, campaign settings, or evidence records generated under v28.

In particular, the historical terms “Certified Path,” “Non-Certified Path,” “Adaptive Certified Rebuild,” and “Matched-Depth Fairness Control” correspond respectively to the final manuscript concepts UCAC, FDNC/MDNC depending on depth context, UCAC adaptive rebuild or CERT_REBUILD, and the MDNC-based matched-depth fairness protocol.

Legacy v28 term	Publication term	Meaning in final paper	Notes
Certified Path	UCAC	UCC-Certified Adaptive Construction path	Use when the path includes UCC decisions, certified governance, adaptive rebuild, or promotion control.
Non-Certified Path	FDNC or MDNC depending on context	Native BTNS construction without UCC governance	If evaluated at initial depth, it is FDNC. If rerun at UCAC final depth, it is MDNC.
Fixed-depth Non-Certified Path	FDNC	Fixed-Depth Native Construction	Native path at the initially declared support depth.
Matched-depth Non-Certified Path	MDNC	Matched-Depth Native Control	Native path rerun at K_finalselected by UCAC.
Adaptive Certified Rebuild	UCAC adaptive rebuild / CERT_REBUILD	Certified adaptive reconstruction at deeper support	Mechanism inside UCAC, not a separate path.
Matched-Depth Fairness Control	MDNC + matched-depth fairness protocol	Fairness control comparing UCAC with native construction at the same final depth	Use “MDNC” for the path and “matched-depth fairness” for the interpretation rule.
Certified vs Non-Certified comparison	UCAC vs FDNC or UCAC vs MDNC	Depends on whether the native comparator is initial-depth or matched-depth	Must be disambiguated in the addendum.
Certified decision chain	UCC decision records	Records TRUE/FALSE/TUBE and action tokens	Same concept, improved terminology.
